Treatment

# AD overview

Examples of different types of digesters

What types of wastes can they treat?

When to use a specific type of digester?

Limitations associated with different digesters

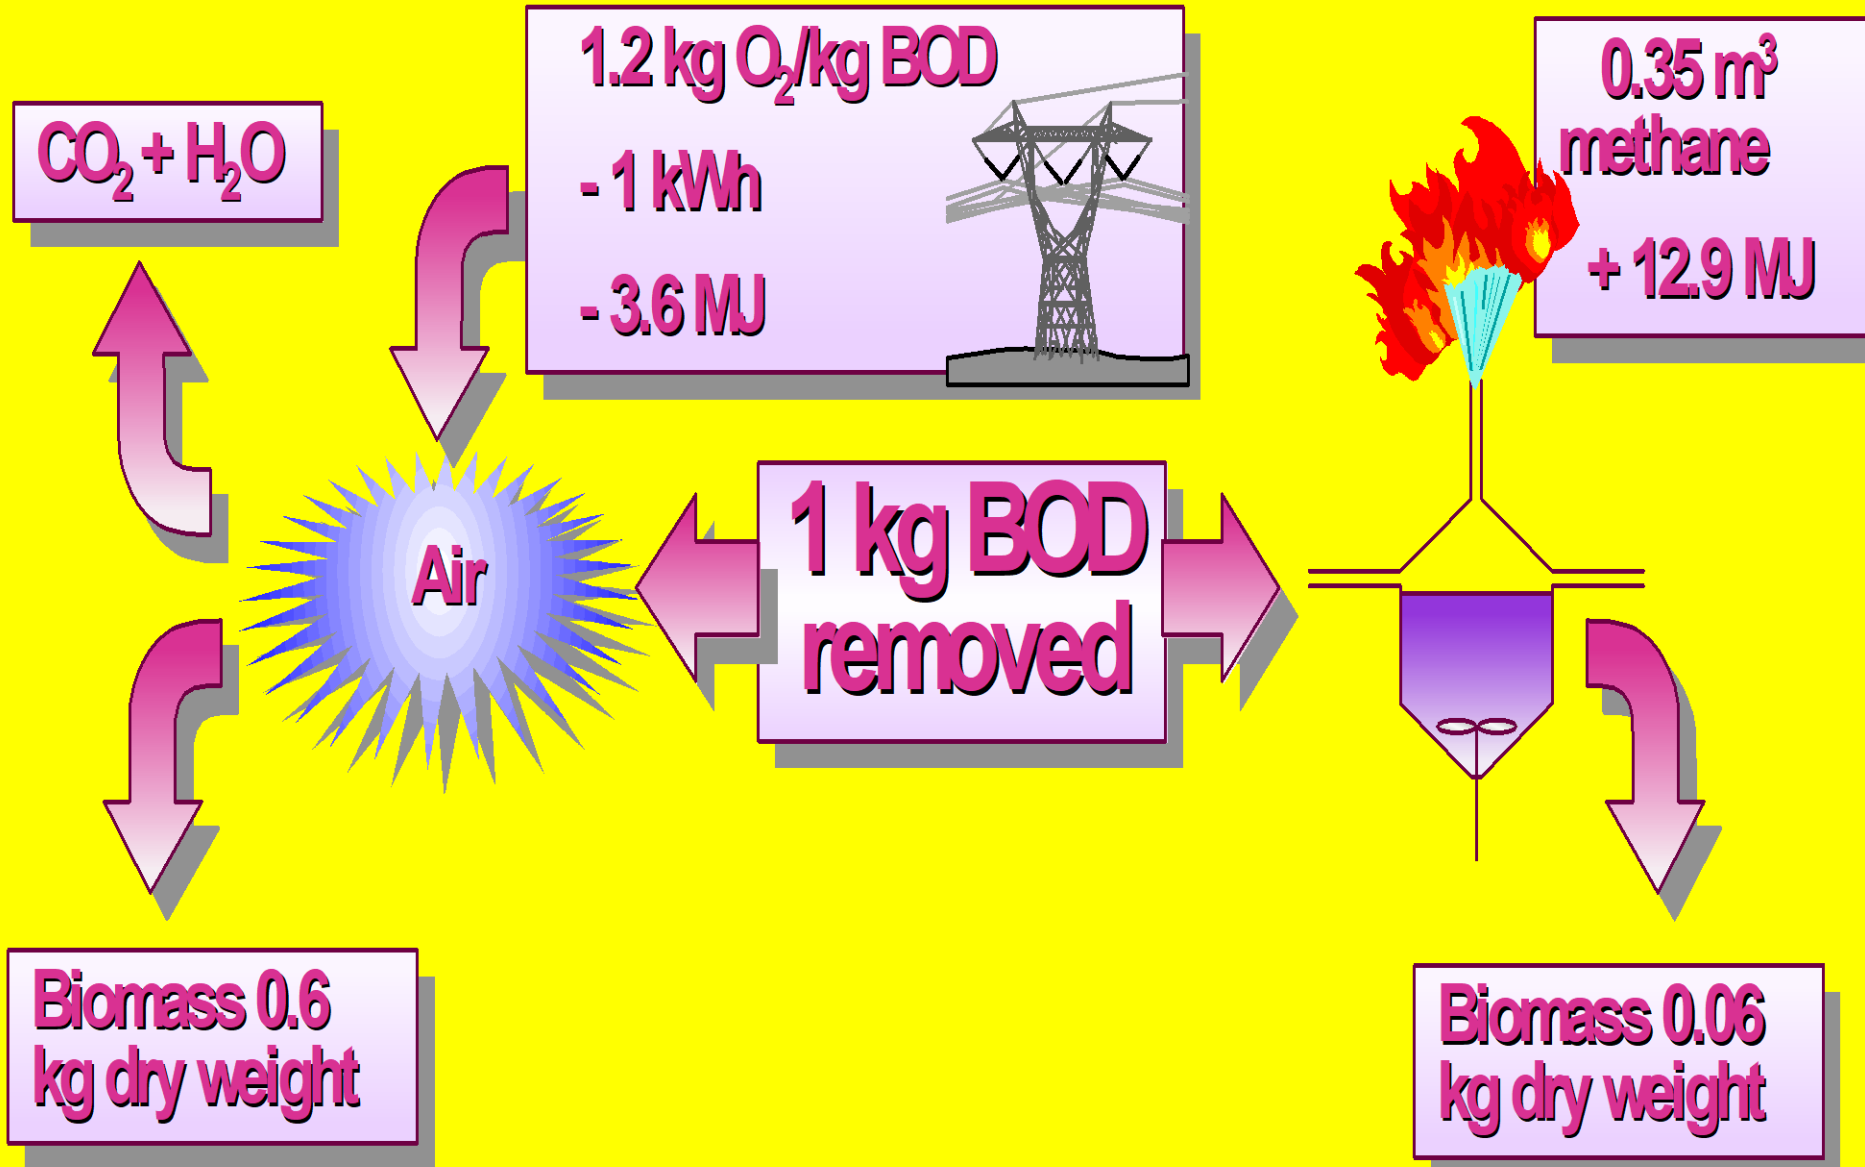

How well do they work?

What limitations?

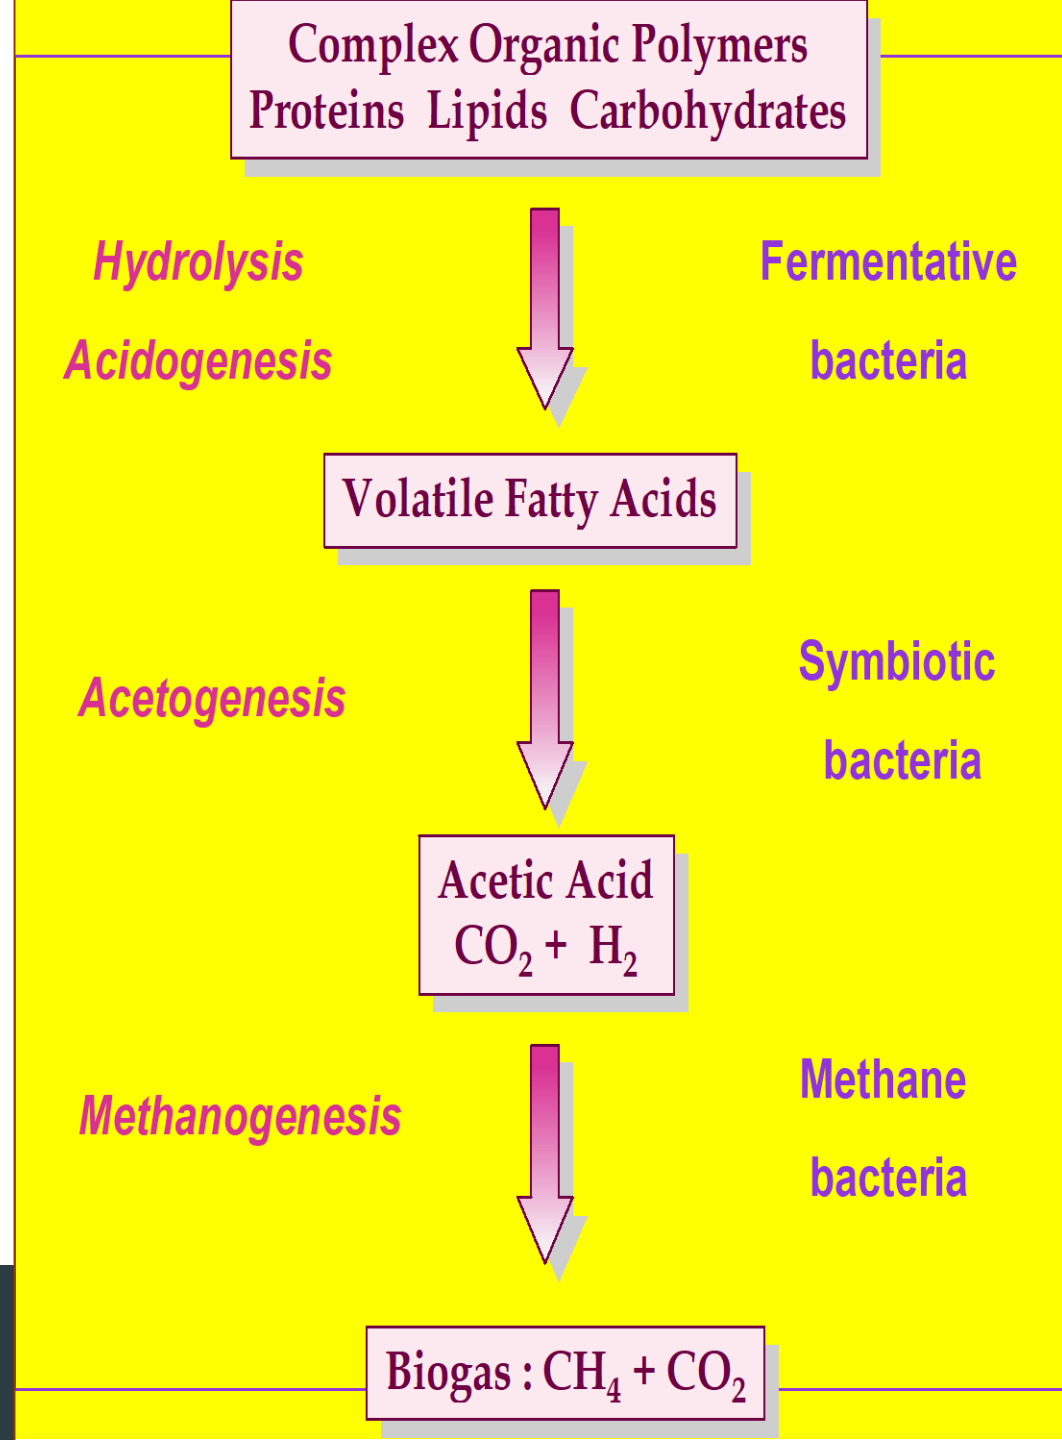

# AEROBIC TREATMENT

# ANAEROBIC TREATMENT

## Biochemical steps

When the only  
tool you have is a  
hammer, every  
problem is a nail.

Abraham Maslow

# Unmixed anaerobic lagoons, & Uncovered anaerobic ponds!!

- ▶ The reasons I like AD are largely negated with these...
- ▶ Fill up with sludge fast
- ▶ Poorly controlled / operable
- ▶ Poor gas recovery - often significant carbon emissions
- ▶ Inconsistent performance
- ▶ Often significant odour issues

## Fixed Film and Moving Bed Anaerobic reactors

- ▶ There are a range of these systems internationally, however they have a number of issues.
- ▶ Not that any of them
- ▶ Sludge blockage, channelling, calcium build up issue.
- ▶ Expect performance reduction over time. 5 -10 yrs

# CSTR reactor configuration

- ▶ HRT = SRT if good mixing
- ▶ Required high level of mixing power
- ▶ Process capacity reliant on volume
- ▶ Long HRT/SRT required for process stability
- ▶ Flexible to accommodate broad range of wastes
- ▶ No solids separation = High effluent TSS and COD

# Municipal Sludge digesters

## CSTRs

- ▶ Food wastes
- ▶ Rendering wastes
- ▶ Paunch Contents

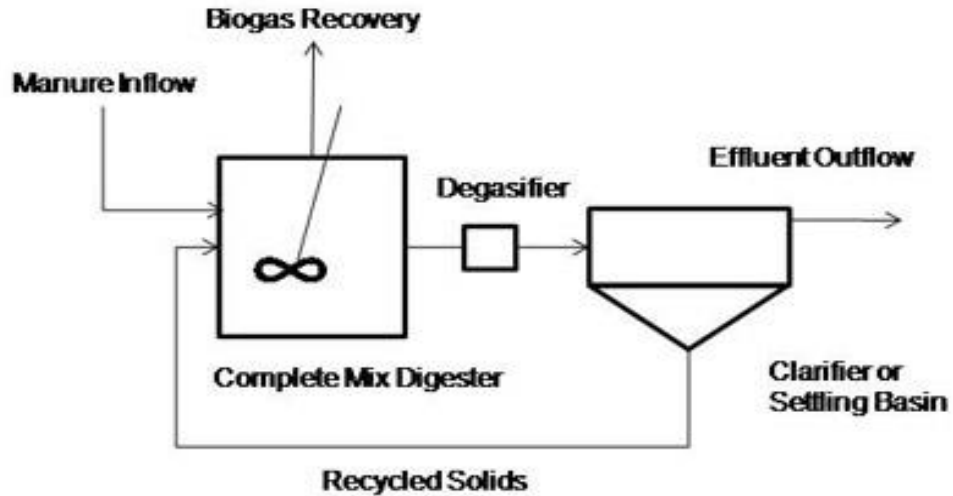

**Designed for -42 degree C**

# Anaerobic Contact Systems

Most Versatile - lot of waste types, and waste characteristics, can accept difficult wastes.

High mixing energy required, lower volume required.

Robust - With correct design can accommodate many different waste types

Improved effluent quality - includes separation systems

Relatively expensive to build and operate.

# Anaerobic Contact separation technologies

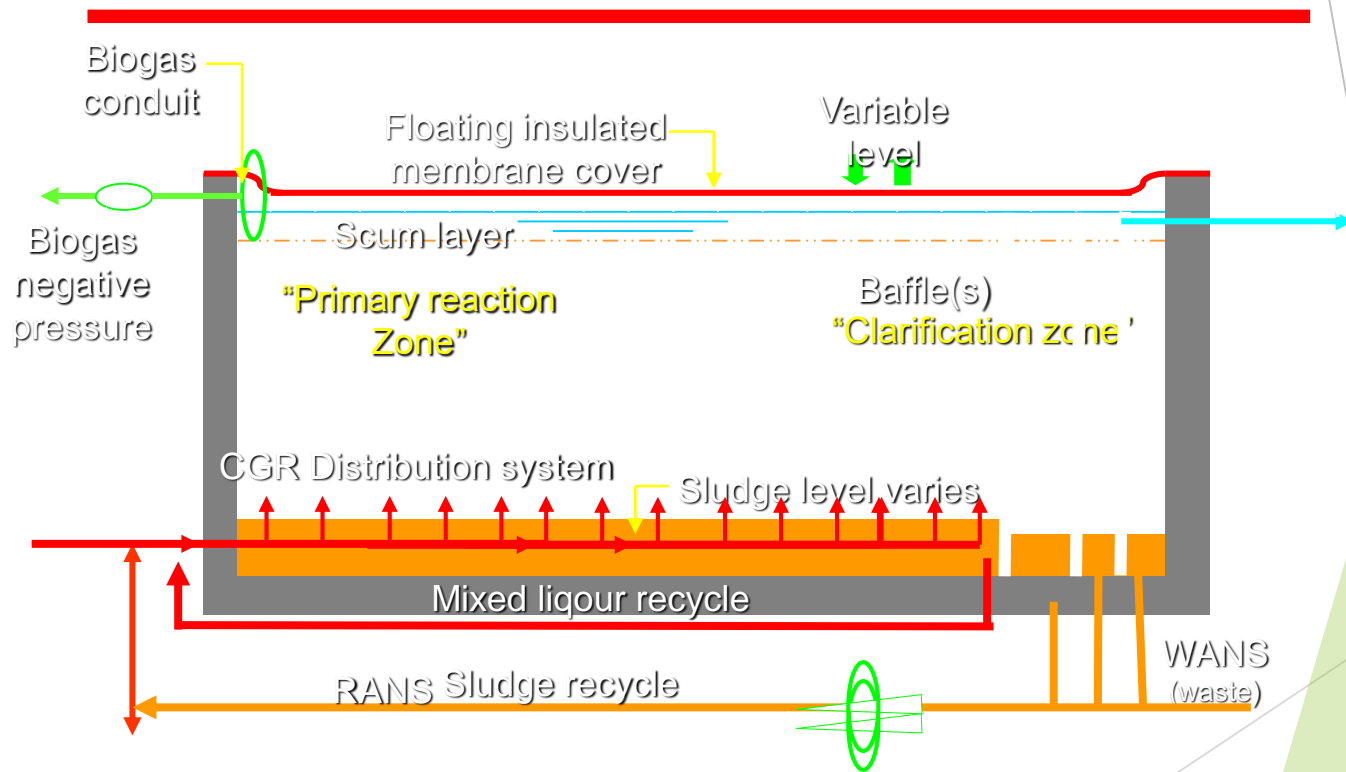

# Anaerobic Contact

# Reactors with Upflow principle

- ▶ Introduce the feed at the bottom
- ▶ Make the feed flow up through the sludge blanket
- ▶ Use the gas production to provide part of the mixing energy.
- ▶ Reduced parasitic energy consumption.
- ▶ Allows much larger reactors at lower cost
- ▶ Lowers short circuiting risk,
- ▶ Can have different conditions at different point in the reactor
- ▶ Can periodically feed zones in the reactor.

# CIGAR process schematic

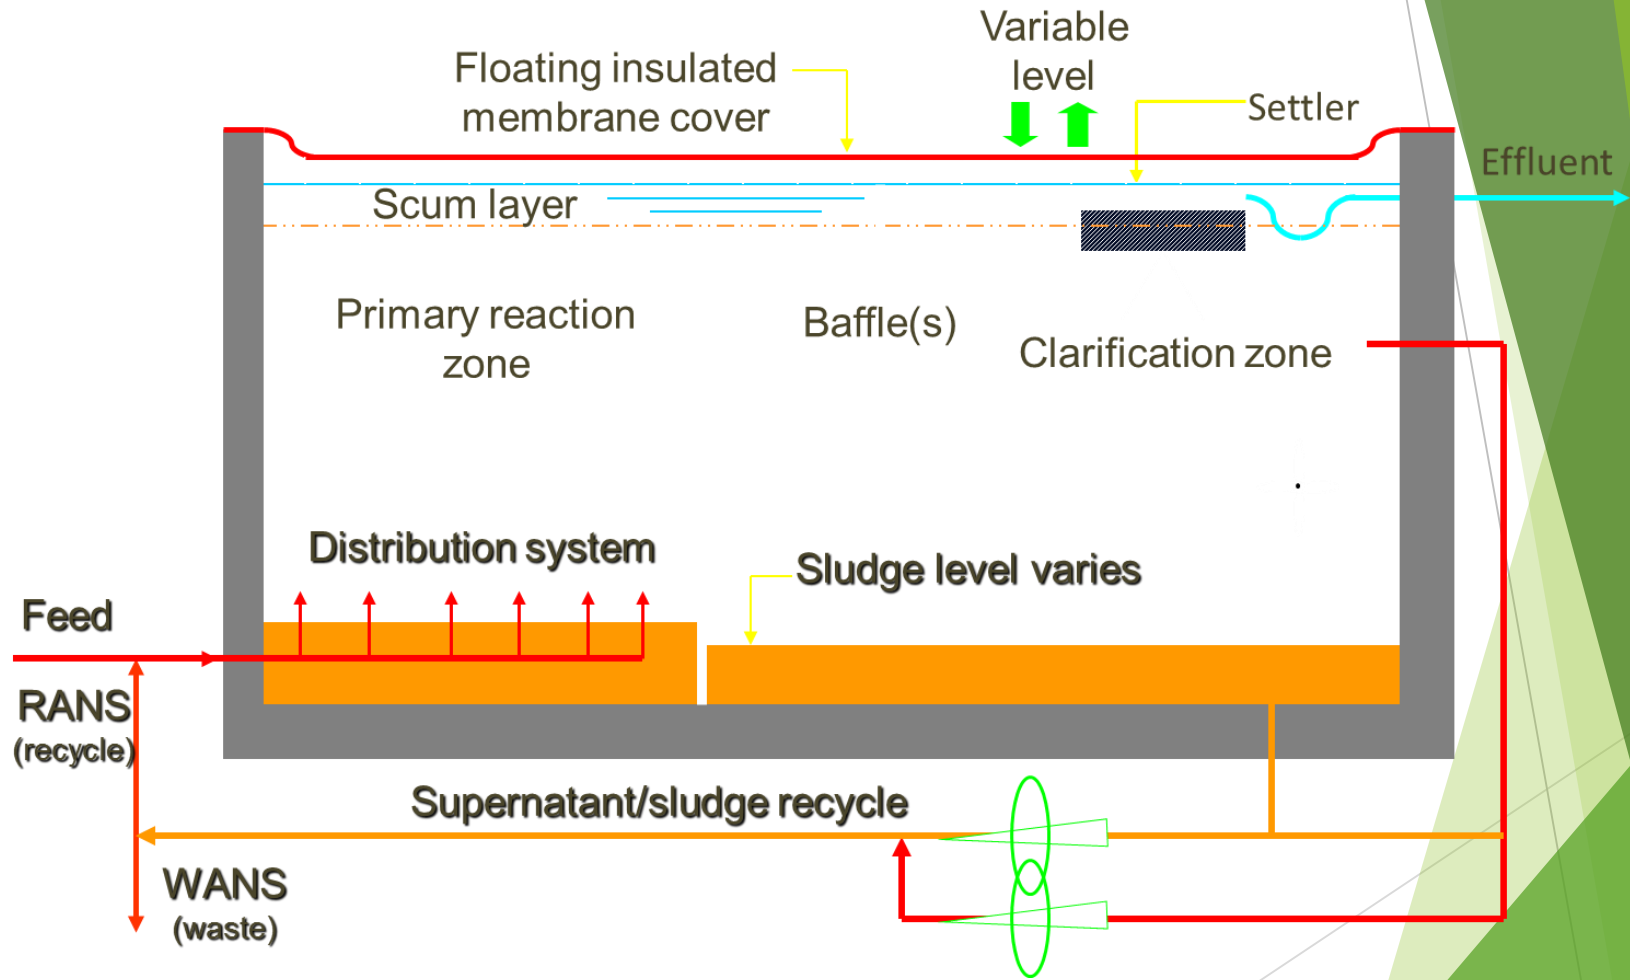

# In ground engineered reactors

- ▶ Very robust - large sludge inventory, increased resilience over time, great buffering.
- ▶ Versatile - large range of wastes can be treated
- ▶ Low rate - but very large capacity systems possible for low cost, due to low cost “tank” construction
- ▶ Economically often significantly better than other types of system
- ▶ Medium Effluent quality
- ▶ Be careful for High Calcium wastes, struvite producing wastes, and wastes with heavy or long stringy particles

Kentucky, USA.

**Salad Dressing plant - Commissioned July 2008**

# Typical application

	Application	Advantages	Limitation	Loading Rate	HRT (days)
Inground	Wastewater Treatment	Low mixing energy, high capacity	Footprint	0.3-3.0	7-14
CIGAR	Biogas Production	Low mixing energy, high capacity	Footprint	<3.0	14-42
CSTR	Solids Digestion	High Solids	Effluent Quality	1- 7	20-30
Contact	High rate complex wastes	Medium to high strength liquid wastes	Broad application	3 - 8	5 -15
An-MBR	High quality effluent	Effluent Quality	Operating Cost	5-10	0.1-5
ECSB	Very High rate, non complex wastewater	Smaller Footprint	To be discussed	10-35	0.125-1.5

Ca <sup>2+</sup>	4700
K <sup>+</sup>	6100
Na <sup>+</sup>	7600

# Other Issues with High $\text{SO}_4$ Levels

- ▶ Odour
- ▶ Corrosion
- ▶ Poor quality of the biogas (reduced  $\text{CH}_4$  yield;  $\text{H}_2\text{S}$  removal needed)
- ▶ Reduced COD removal efficiency due to  $\text{H}_2\text{S}$  in the effluent
- ▶ Reduced bio-availability of micronutrients by sulphide
- ▶ Precipitation

1 mol  $\text{SO}_4$  equals 2 mol  $\text{O}_2$   
(or 1g  $\text{SO}_4$  “converts” 0.67g COD)

# High-Rate Technologies

# AD treatment performance

The slide features a white background with abstract, overlapping green geometric shapes on the right side. These shapes include various shades of green, from light to dark, forming a complex, layered pattern that tapers towards the top right corner.

# Starch based Ethanol AD performance

## COD Removal Efficiency

## Salad Dressing plant Operating Results

Parameter	Raw Wastewater	AnMBR Effluent
Avg. COD (mg/l)	33,600	190 (99.4%)
Avg. BOD (mg/l)	18,000	20 (99.9%)
Avg. TSS (mg/l)	10,900	< 1 (100%)
Avg. FOG (mg/l)	850	---
Temperature (°F)	77	95

# Further comments

- ▶ Wastewater characteristics directly impact potentials of anaerobic treatment for industrial wastewater
- ▶ Most important characteristics are
  - ▶ Presence of suspended solids, Fat, Nitrate, potential Precipitation
  - ▶ Poor buffer capacity
  - ▶ Strength and composition of biodegradable COD
  - ▶ Presence of alternate electron acceptors (i.e.  $\text{SO}_4$ )
  - ▶ Toxic components
  - ▶ Nutrients
  - ▶ Temperature
- ▶ Wastewater characteristics need to be included in reactor design, only if appropriately addressed, will successful treatment be assured
- ▶ VERY IMPORTANT TO SELECT AN APPROPRIATE AD CONFIGURATION
- ▶ Seek independent advice.

Technology isn't the  
reason why not

## Conclusion

- I genuinely think that we can save and generate energy from organic wastes significantly more than we currently do.
- We can recover nutrients and recycle them significantly reducing fertiliser import,
- Be very careful if selecting a high rate AD system, they work well in a narrow range of situations.
- Both Anaerobic Contact, and engineered inground system are flexible and robust.
- A positive is that there are a number of projects developing around the country where AD systems are being installed.
