

Water New Zealand Conference 2019
Rico Parkinson

Using murky data to clean up wastewater flooding

- “You can have data without information, but you cannot have information without data”

Introduction

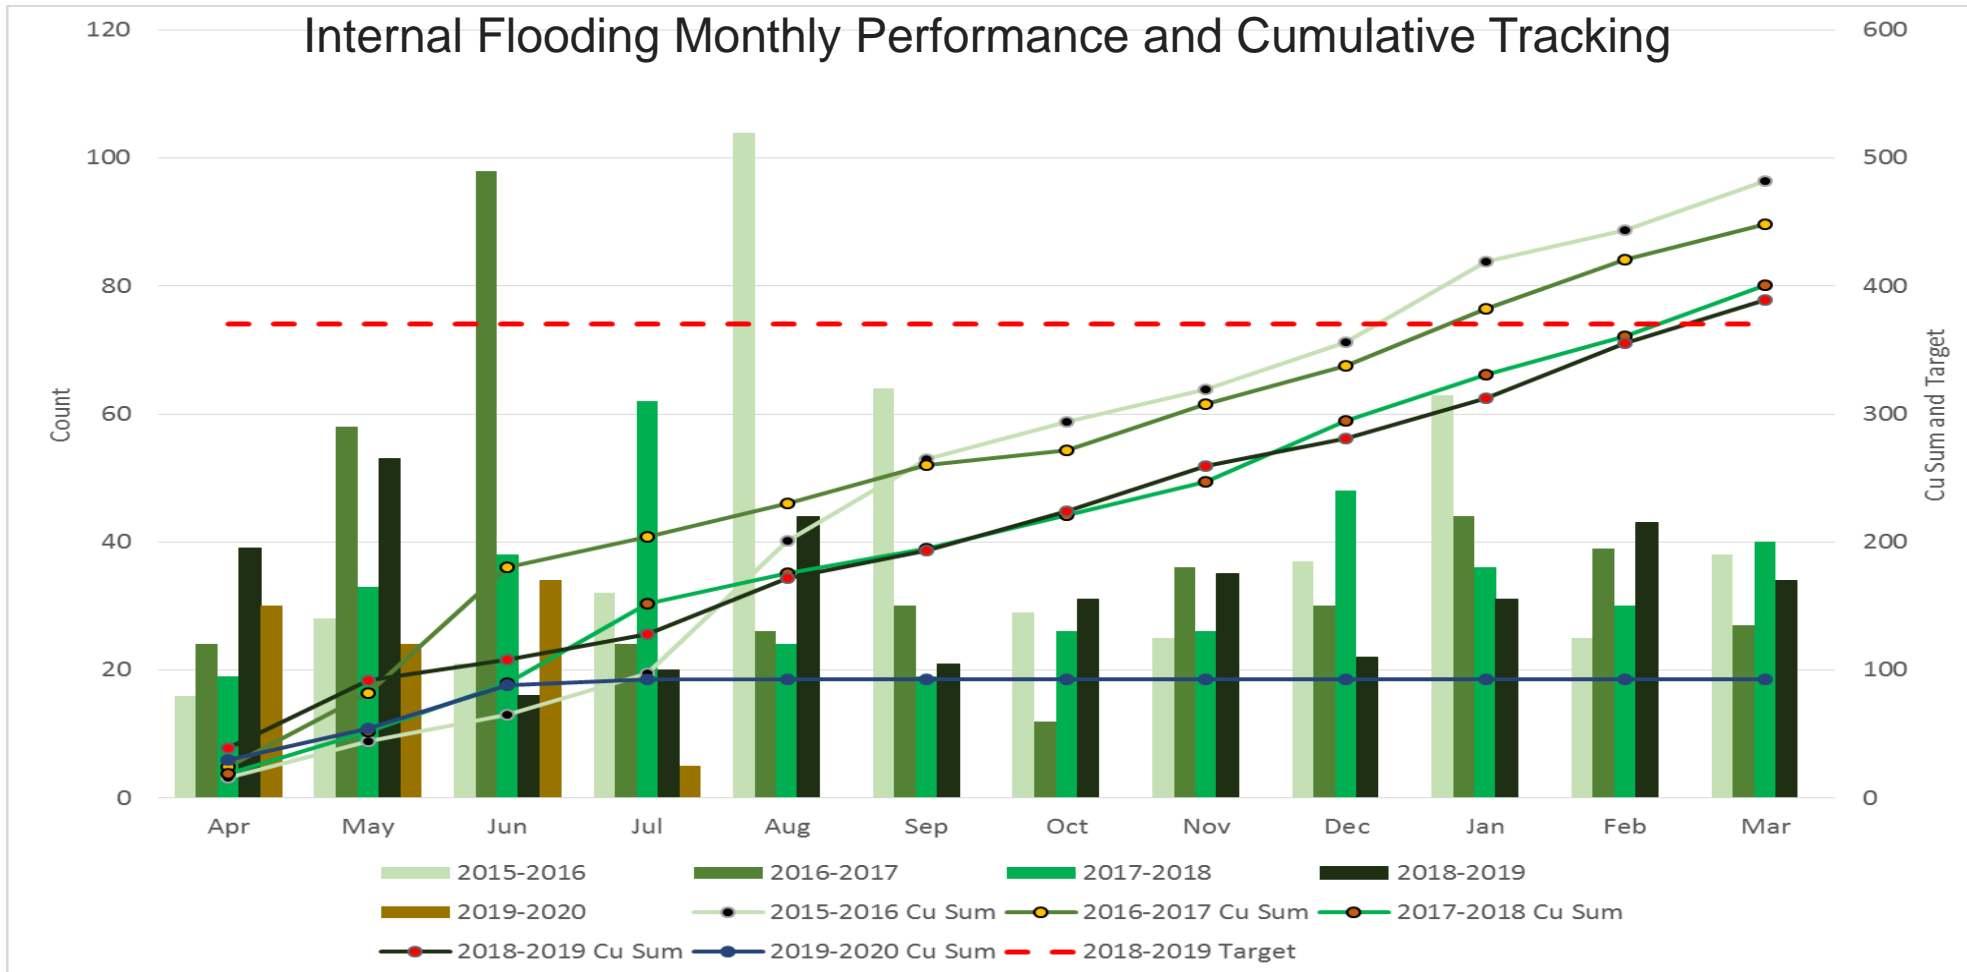

1. Project Drivers
 - Current Data Sources and Processes
2. Data Analysis Solutions
 - Root Cause Analysis
 - Predictive Analytics
 - Automated FME Analysis
 - Data Collection and Display
3. Operational Solutions
 - Mapping of Sewers
 - Targeted FOG Dosing
 - Property Level Alarms (PLA)
4. Buchan Trap Example Case
5. Conclusions

Project Driver – Reducing Flooding's

AMP5 Performance	2755 (551/yr)
AMP6 Target (25%)	2070
Deadband	2215
Collar	2440

Five year AMP target
25% Reduction in Internal Property Flooding's

First three year were over target.

Project Driver – Entire Region

Three years into the AMP risk of Penalties if trends didn't continue downwards.

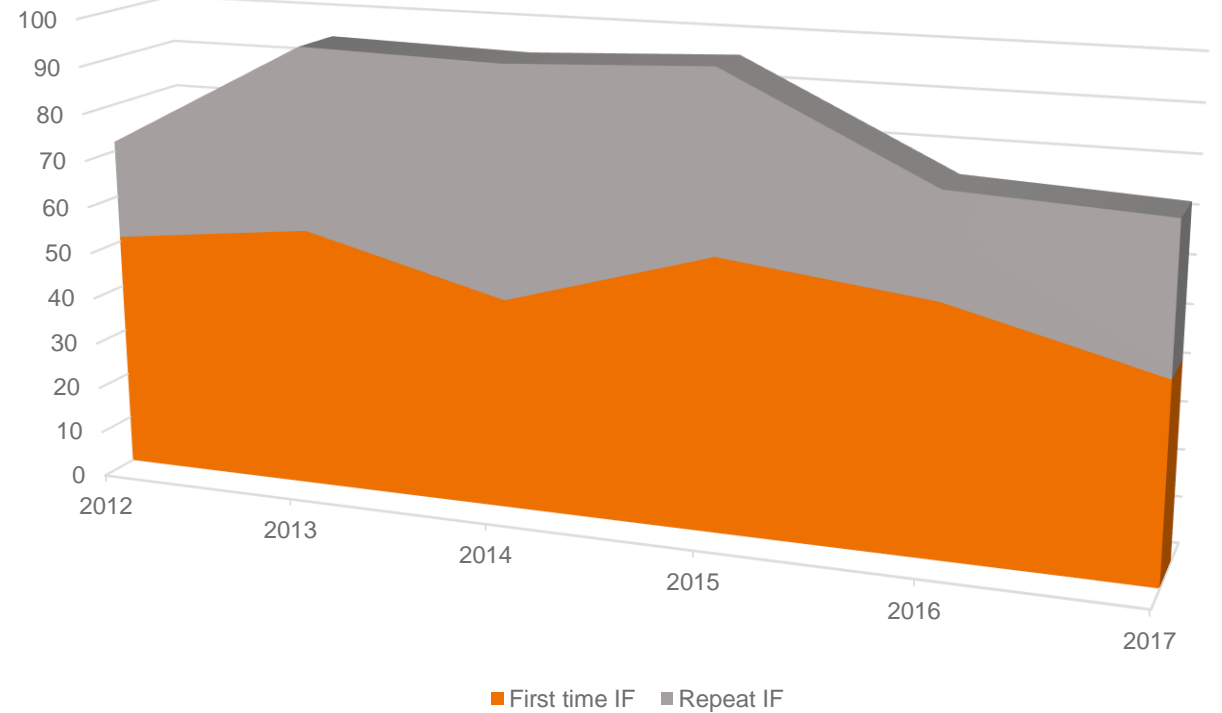

Project Drivers

Internal Flooding Events

First Time and Repeat Internal Flooding within Project Zone

Even though region wide trends were reducing, properties within particular areas are remaining steady.

Flooding Solution Processes Terms

Flood Mitigation

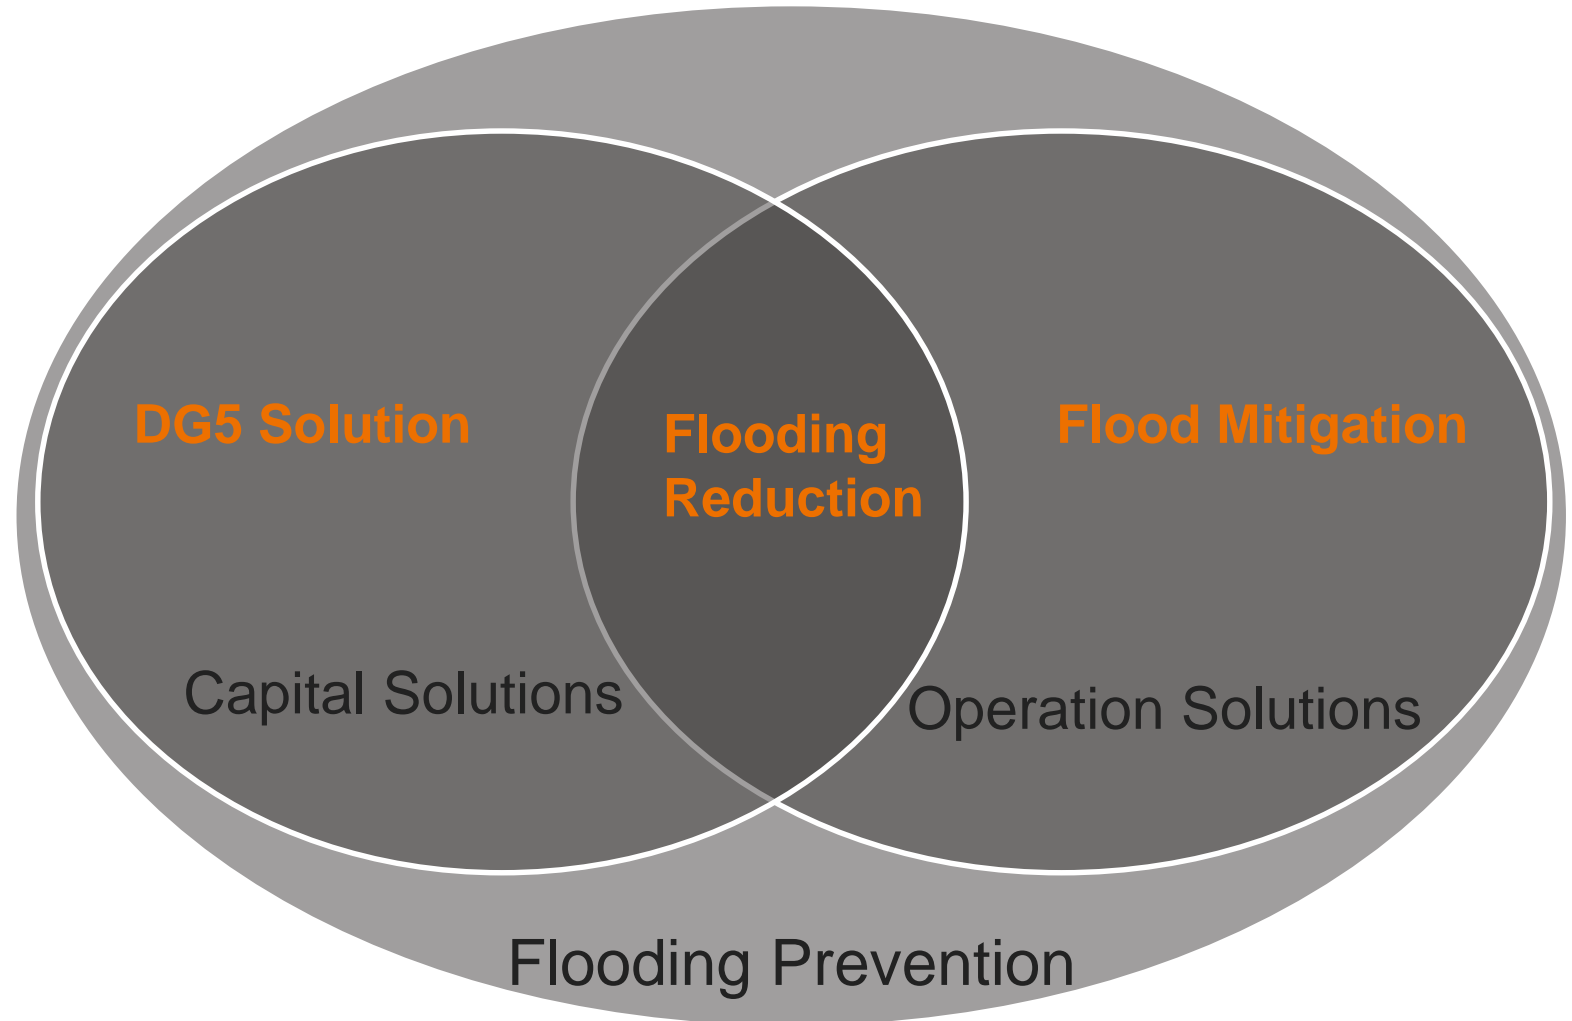

Reactive prevention to prevent flooding repeating on properties

DG5 Solutions

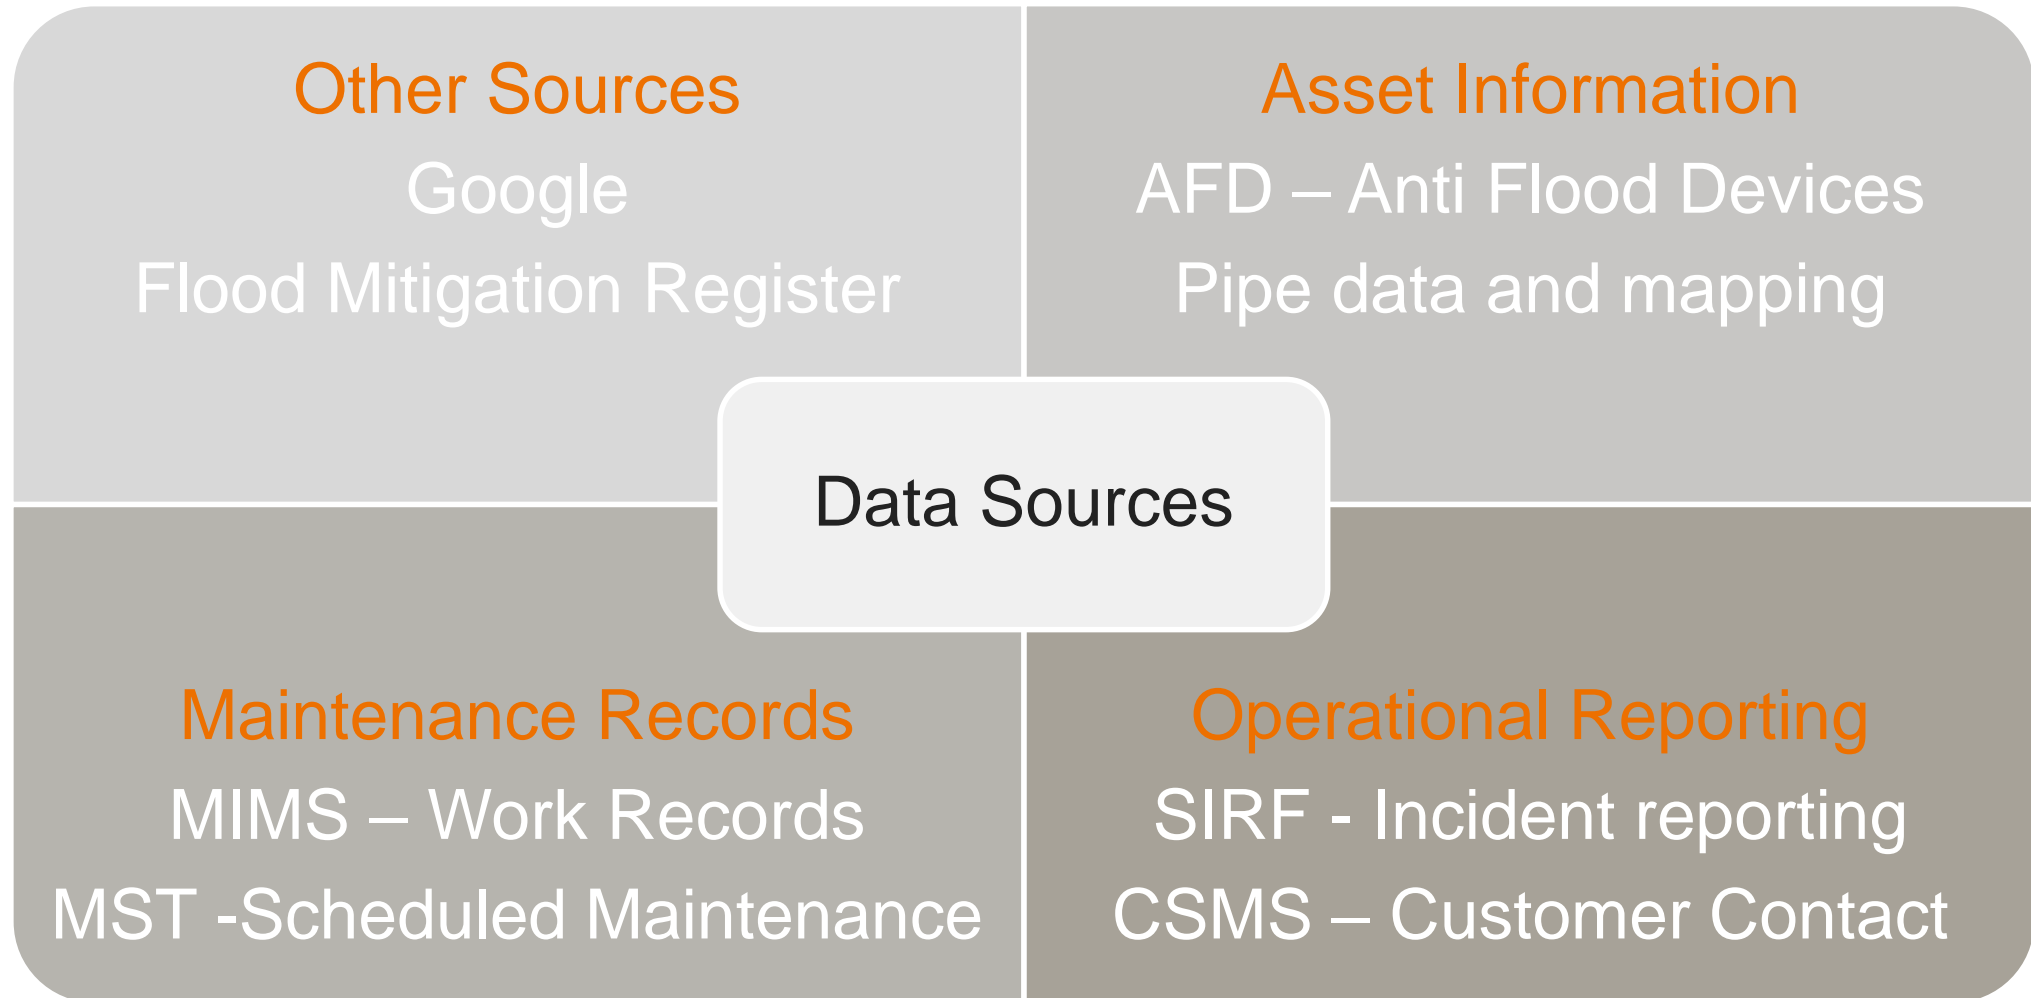

Capital investment to increase capacity related flooding, normally reactive

Flood Reduction Project

Proactive prevention to prevent new flooding and repeating on properties

Data Source Summary - Examples

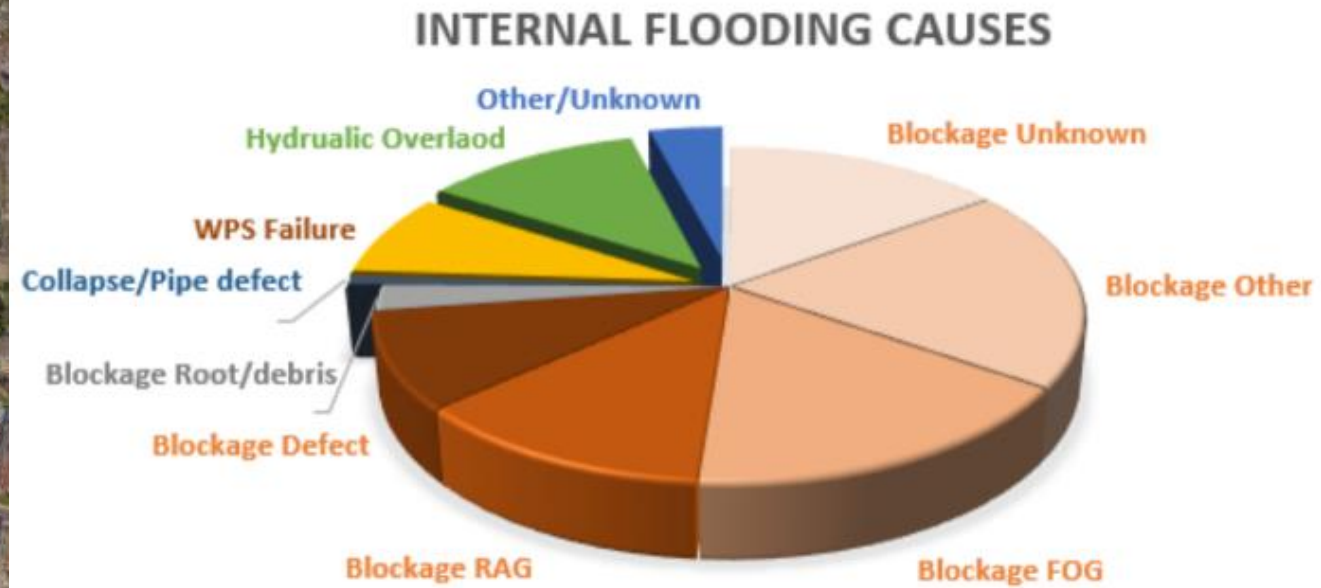

- Root Cause Analysis
- Predictive Analytics
- Automated FME Analysis
- Data Collection and Display

Data Analysis Solutions

Root Cause Analysis

10 Zones with the Flood Reduction Project

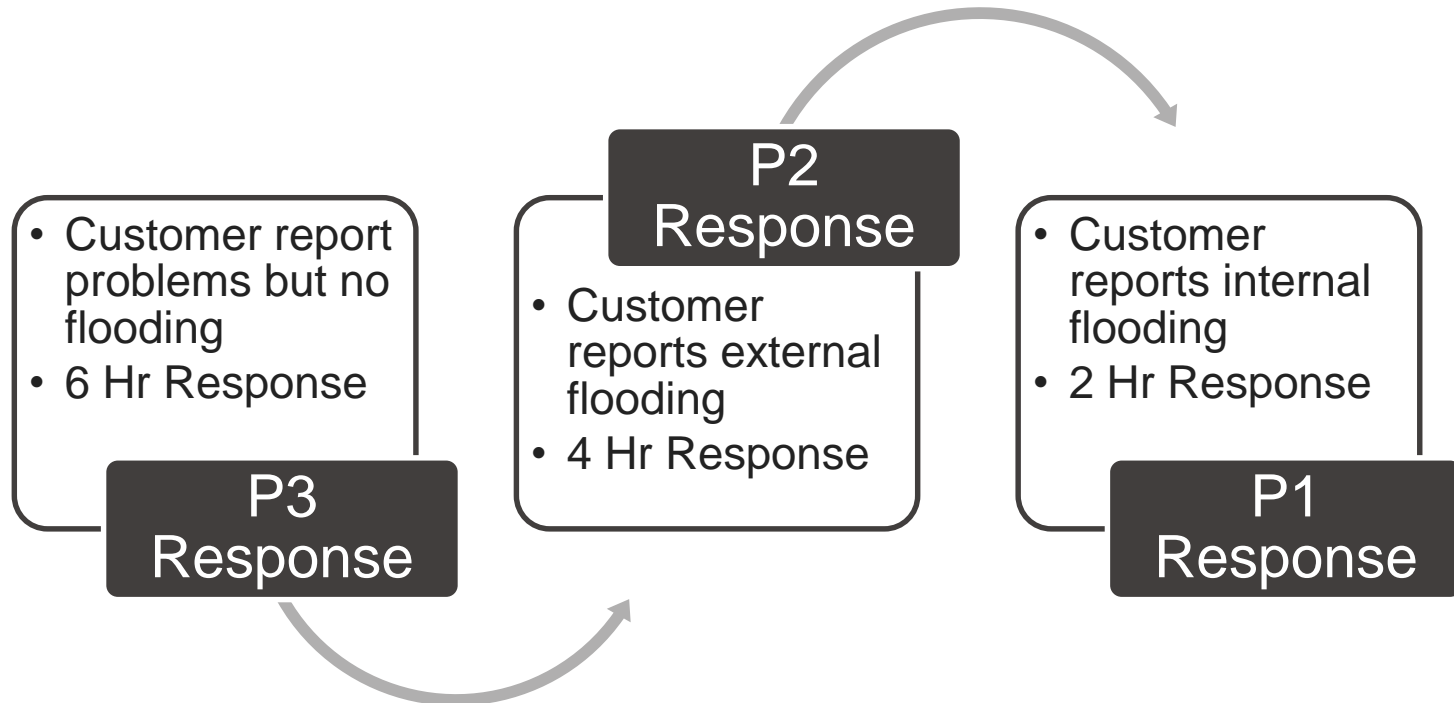

Root cause of flooding assessed for each area, to identify possible solutions that could be trialed in particular areas.

Predictive Analytics

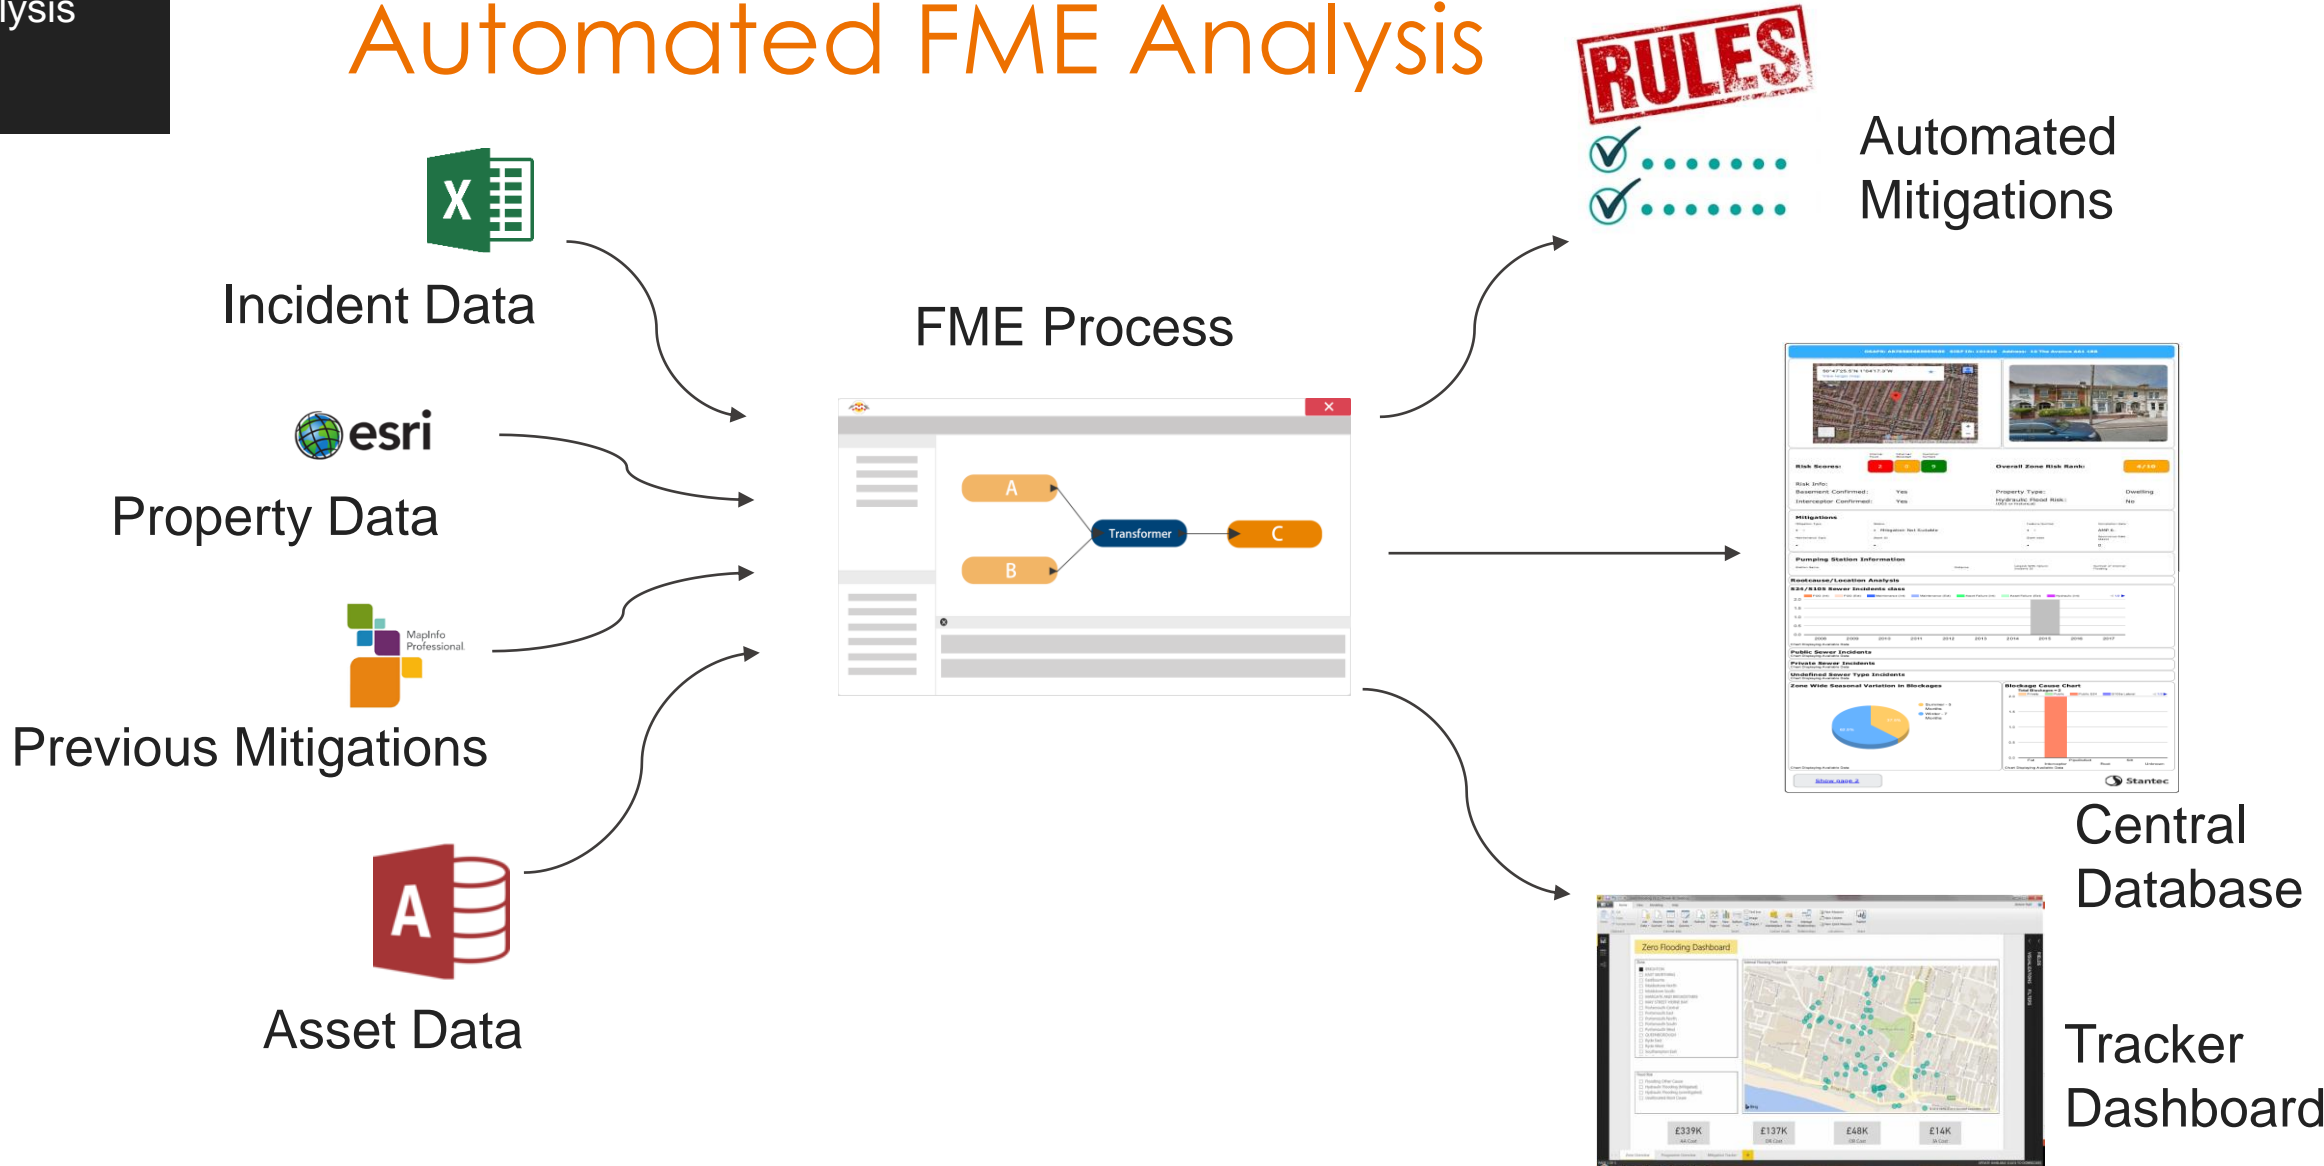

Probability = $L/(L+1)$ where

$$L = \text{Exp}[-4.9 + 0.5 * \text{IFatProperty} + 0.6 * \text{IFatSewer} - 0.1 * \text{IncidentatProp} + 0.06 * \text{MHRel_Elevation} + \text{if(Commercial,0.95)} + \text{if(FOUL, -0.58)} + \text{Proportion_Basement} + \text{if(BasementFlag, 2)} + \text{if(P3,-0.77)]$$

Identifies properties with opportunities to prevent flooding in this response

Automated FME Analysis

OSAPR: A578585689959685 SIRF ID: 101010 Address: 10 The Avenue AA1 1BB

50°47'25.5"N 1°04'17.3"W

Risk Scores: Internal Flood: 2, External Flooding: 0, Customer Contact: 9. **Overall Zone Risk Rank:** 4/10

Risk Info:
 Basement Confirmed: Yes
 Interceptor Confirmed: Yes
 Property Type: Dwelling
 Hydraulic Flood Risk: (DGS or Historical) No

Mitigations

Mitigation Type	Status	Feature Number	Completion Date
Mitigation Not Suitable			AMP 6.

Pumping Station Information

Station Name	Distance	Largest WWS Failure Incident ID	Number of Internal Flooding

Rootcause/Location Analysis

S24/S105 Sewer Incidents class

Public Sewer Incidents

Private Sewer Incidents

Undefined Sewer Type Incidents

Zone Wide Seasonal Variation in Blockages

Blockage Cause Chart

Total Blockages = 2

Stantec

Type	Automated Assessment		Desktop Review		Operational Review		Take Forward		Actions Implemented	
	Action	Proposed	Date	Proceed	Date	Proceed	Date	Proceed	Date Order Raised	Date Complete
Investigation	CCTV	No								
	Property Survey	No								
Preventative	Education	No								
	Dosing	No								
Mitigation	AFD	Yes								
	Interceptor removal	Yes	05/18	Yes						
	Flood Alarm	No								
	Network Monitor	No								
Repair										

SR

Latest Progress Comments:
Survey the interceptor to assess feasibility for removal

Review

Further works required following investigation?
If CCTV survey or property survey finds defects ... Not sure if we can automatically link this to the return of survey info???

Past prevention/mitigation flooding?
If flooding occurs after completion date for the preventative or mitigation measures listed above, then 'Yes', flooding date and SIRF reference

Potential flood risk reduction:
If any of the preventative and/or mitigation measures above are completed, and there has been no post-mitigation flooding calculate:
No. of internal flooding incidents confirmed in SIRF/Data set duration = x incidents prevented per annum
E.g. 5 incidents / 10yr data set = 0.5 incidents prevented per annum (this info will be used for benefits tracking)

[Show page 1](#)

- Summary of properties used to review automated actions
- Used to track progress of individual property solutions
- Collates and displays all key information

- Mapping of Sewers
- Targeted FOG Dosing
- Property Level Alarms (PLA)

Operational Solutions

Mapping of Shared Sewers

- Data analysis used to identify properties with conflicting responsibilities for similar events.
- Shared sewers can be hard to identify onsite.

Targeted FOG Dosing

- Data Analysis used to identify clusters of FOG related issues
- FOG build up unable to be prevented by education alone.
- Discussion with Operational team to identify key locations for in network dosing

FOG build up changes over 3 months.

Property Level Alarms

- Data Analysis used to identify properties flooding due to blockages
- Removed properties also at risk of hydraulic overload
- Property visit to review if levels indicated no warning is possible within the network

Buchan Traps

Example Case Study

Buchan Trap – What are they

Vertical Riser

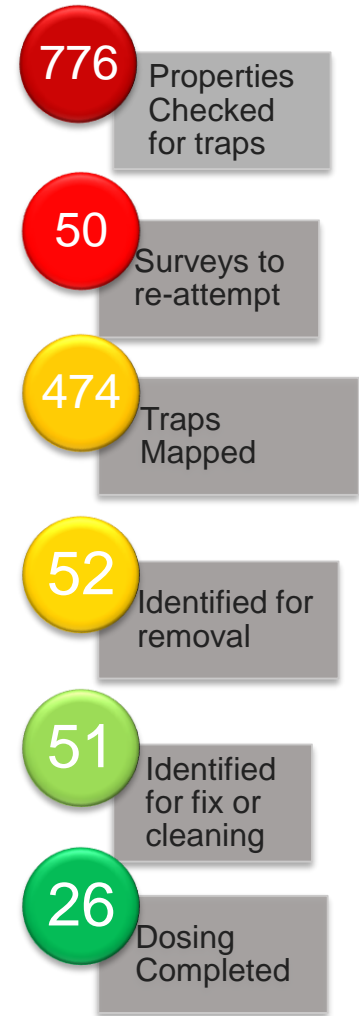

Buchan Trap Cover

Buchan Trap – Flooding in waiting

Buchan Trap – Identifying the Problem

Buchan Trap – Implementing Solutions

- Removal of shallow easy to access Traps
- Cleaning of Sediment filled traps
- FOG Dosing of FOG identified traps (trial)
- Repair of Damaged lids and Riser
- Installation of Alarms on known deep problem traps

Conclusions

- “You can have data without information, but you cannot have information without data”
- Know your data and how “murky” it is
- Use data to understand the problems
- Use process/decision making automation where possible

Questions?

Although there is no silver bullet to fix complex sewage flooding problems, data can be more valuable than gold.
